The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA comparison encoded assembly system of strains of Salmonella. Bischerichia coli and assembly system of strains of Salmonella. Escherichia coli and context of the production of fimbriae comprising recombinant of a recombination of a recombinant gene into the chromosome of the compositions recombination of a recombinant gene composition services and (4) aliciting an immune response in an animal. Composition generates and (4) eliciting an immune response in an animal. Composition sequence or sequences grown on a salmonella, E coli or acid sequence or sequences grown on a Salmonella, E coli or acid sequence or sequences grown on a Salmonella, E coli or acid sequence or sequences grown on a Salmonella, E coli or acid sequence or sequences grown on a Salmonella, E coli or acid sequence or sequences grown on a Salmonella, E coli or acid sequence or sequences grown on a Salmonella, E coli or acid sequence or sequences grown on a Salmonella, E coli or acid sequence or sequences grown on a Salmonella, E coli or acid sequence or sequences grown on a Salmonella, E coli or acid sequence or sequence in an animal. In a fimbrial presentation containing an aminon acid polymer cell and introducing the carrier frabrial submit protein possesses both the corresponse the heterologous antigens are presented in high numbers (up to vaccine, the carrier fimbrial submit proteins are usually strong immunogens, which may be important for an efficient live vaccine, the carrier fimbrial submit proteins are easy and manner of inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                  Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 LVTRVVTHEMAHAGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYGG 120

vaccine; immune response; immunogen.

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA comparison that control is sequence which encodes a foreign epicope or antigen. Also described are: (1) use of thin aggregative finbries (SET)/TAE) nucleation depended assembly system of strains of Salmonella. Escherichia coli and control is the production of fimbriae comprising recombinant of a recombinant gene into the chromosome of the directing recombination of a recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the colymer into the animal in conjunction with a carrier of diluter. (1) is cuseful for the expression of recombinant AgfA protein mind to useful for the expression of recombinant AgfA protein mind to useful for system the heerologous antigens are presented in high numbers (useful for the expression of recombinant AgfA protein possesses both the immune the harbrid fimbrial subunit protein possesses both the immuneration which may be immortant for an immuneration which an immuneration which may be immortant for an immuneration an immuneration an immuneration an immuneration an immuneration an immuneration an immuneration an immuneration an immuneration an immuneration an immuneration an immuneration an immuneration and adhesion properties relevant for an immuneration and immineration immineration immineration immineration immineration immineration immineration im Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal. against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA segment which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative finbriae (SEPI)/TAPP) mucleation depended assembly system of strains of Salmonella, Escherichia coli and therefore the production of fimbriae comprising recombinant of the production of fimbriae comprising recombinant of directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene homologous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid polymer comprising a replacement segment or segments of foreign amino acid polymer into the animal in conjunction with a carrier or diluent. (1) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to sourcine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immunogens, which may be important for directing an immunogens, against the inserted epitope, and public fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal. 61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNYDQLVTRVVT 120 -----NYDQLVTRVVT 97 98 HEMAHADQWNAKNSDITVGQYGGNNAALVNQTASDSSVMVRQVGFGNNATANQY 151 Salmonella, agfA, chromosomal gene replacement, fimbrin, epitope, vaccine, immune response, immunogen. -NOTASDSSVMVRQVGFGNNATANOY AgfA::PT3#4 amino acid sequence SEQ ID NO:18. 3 Kay 61 SDARKSETTITQSGYGNGADVGQGAD-Disclosure; Page 136; 139pp; English AAB36349 standard; protein; 151 AA Collison SK, 05-APR-2000; 2000WO-CA000356. 99US-0127888P (first entry) Salmonella enteritidis. Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNYDQLVTRVVT 120

Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) useful for the expression of recombinant AgfA protein which is useful eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MKLLKVAAFAAIVVSGSALAGVVPQWGGGNHNGGGNSSGPDSTLSIYQYGSANAALALQ

cc assembly system of strains of Salmonella, Bscherichia coli and Enterobacteriaceae for the production of finbriae comprising recombinant of Enterobacteriaceae for the production of finbriae comprising recombinant composed and Agfa-homologue finbrin subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologue species, replacing the enteropous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologue species, replacing the native comprising separating an amino acid polymer comprising a recombinant Agfa protein containing a replacement segment or segments of foreign amino comprising separating a replacement segment or segments of foreign amino cord sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (1) is useful for the expression of recombinant Agfa protein which is useful for celliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to copies/cell), the hybrid fimbrin protein see usually strong communogens, which may be important for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response dimensors to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA control of the encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SPEPA/TAP) mucleation depended assembly system of strains of Salmonella. Bscherichia coli and control of the strains of Salmonella bscherichia coli and depended assembly system of strains of Salmonella. Bscherichia coli and dependent of a recombination of a recombination of a recombinant gene into the chromosome of the homologous species, 'replacing the native copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune response in an animal, protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences in an animal in a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which and adhesion properties relevant for an efficient live vaccine, the carrier finbrial subunit proteins are easy and immunogens, which may be important for directing an immune response in manimal invention of the present invention in s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                            Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYGG 120

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbried (SERIATAR) nucleation depended assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and acceptatore of the production of finbriad congrafaty recombinant of AgfA. CsgA and AgfA-homologue finbrin subunits, respectively; (2) directing recombination of a recombinant gene comprising seperation of a recombinant gene into the chromosome of the homologous species, replacing the native back into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or seconominant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful for system the hererologous antigens and animal. In a fimbrial presentation system the hererologous antigens are presented in high numbers (up to solo, 00 copies/cell), the hybrid fimbrin protein sere usually strong immunogens, which may be important for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                               Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               68.8%; Score 533; DB 3; Length 151; 70.2%; Pred. The peptide or antibody is useful for treating a bacterial infection in a human or animal or in the manufacture of a medicament for the prophylactic treatment of a bacterial infection, such as Escherichia oli, Salmonella or Shigella infection. The peptide that is immobilized on a solid support is also useful as a reagent for determining the ability of a plasma protein to bind to bacteria. The present sequence represents an E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNYDQLVTRVVT 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated peptide capable of binding a mammalian plasma protein, useful in the manufacture of a medicament for the prevention and/or treatment of a bacterial infection, such as Escherichia coli, Salmonella
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDSTLSIYQYGSANAALALQ 60

Sequence 171, Application US/09198452A

Patent No. 655924

GENERAL INFORMATION:
APPLICANT; Griffais, R.
TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragment:
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, previring REPERENCE: 9710-003-999

CURRENT APPLICATION NUMBER: US/09/198,452A

CURRENT FILING DATE: 1998-11-24

NUMBER OF SEQ ID NOS: 6849
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              419 LLKSSASASASASASAG-----GGGGGNGGNGGGG------GGGAGALA---- 460

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 3, Application US/08864038A
Patent No. 6001592
GENERAL INFORMATION:
APPLICANT: Kunio NAKASHIMA et al.
TITLE OF INVENTION: NOVEL POLYBEPTIDE GENE CDNA, VECTOR
TITLE OF INVENTION: CONTAINING SAID CDNA, HOST CELLS TRANSFORMED WITH SAID
TITLE OF INVENTION: ALD POLYPEPTIDE PRODUCED THEREBY, MITH SAID
TITLE OF INVENTION: SAID POLYPEPTIDE, DNA ENCODING SAID POLYPEPTIDE AND ANTIBODY
TITLE OF INVENTION: TO SAID POLYPEPTIDE
NUMBER OF SECUENCES: 4
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 99 VAAAPVVPAVSTSSAAGVAPNPAGSGSNNSPSSSSSPTSS-SSSSPSSPGSSLAESPEAA 157

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
